

Operating Systems Model Question Paper

R23 | II Year - II Semester | 3 Hours | 70 Marks

Original Backlog Buddy practice resource - not an official university paper.

PART A - Answer all questions (10 x 2 = 20 marks)

1. Define a system call.
2. What is a process control block?
3. Define context switching.
4. What is a critical section?
5. State the necessary conditions for deadlock.
6. Define paging.
7. What is thrashing?
8. Define a file allocation method.
9. What is disk scheduling?
10. Define protection domain.

PART B - Answer one question from each unit (5 x 10 = 50 marks)

11. Explain operating-system structures and services.
12. Compare CPU scheduling algorithms with examples.
13. Explain deadlock detection, prevention and avoidance.
14. Discuss virtual memory and page-replacement algorithms.
15. Explain file-system implementation and disk scheduling.

Use previous-paper patterns only for preparation; no question is guaranteed.
